

PJM Synchrophasor Project Update

Yang Chen
Sr. Business Solution Engineer,
Applied Innovation
Operating Committee
April 14, 2022

A hierarchical diagram with a central green box at the top containing the text "2022 Application Updates". A vertical orange line descends from the bottom center of this box and connects to a horizontal orange line. From the left and right ends of this horizontal line, two vertical orange lines extend downwards to the top centers of two separate boxes. The box on the left is orange and contains the text "Automated Generator Model Validation (AGMV)". The box on the right is blue and contains the text "Eastern Interconnection Situational Awareness Monitoring System (ESAMS)".

2022 Application Updates

Automated Generator Model Validation (AGMV)

Eastern Interconnection Situational Awareness Monitoring System (ESAMS)

PJM Planning Study

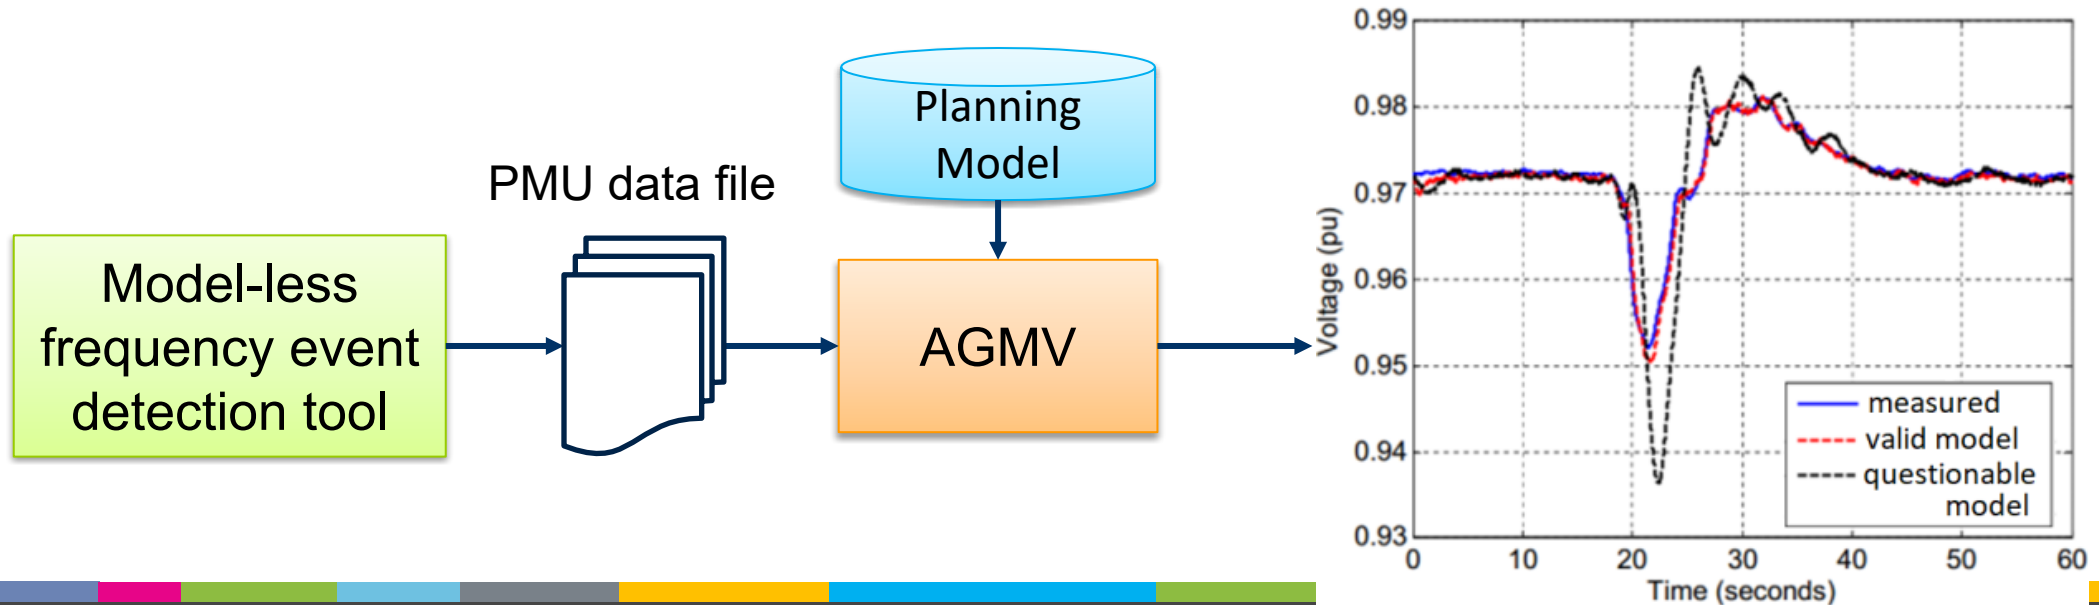

NERC standard MOD 032/033 – PJM uses a manual process for generator dynamic model validation using Synchrophasor data.

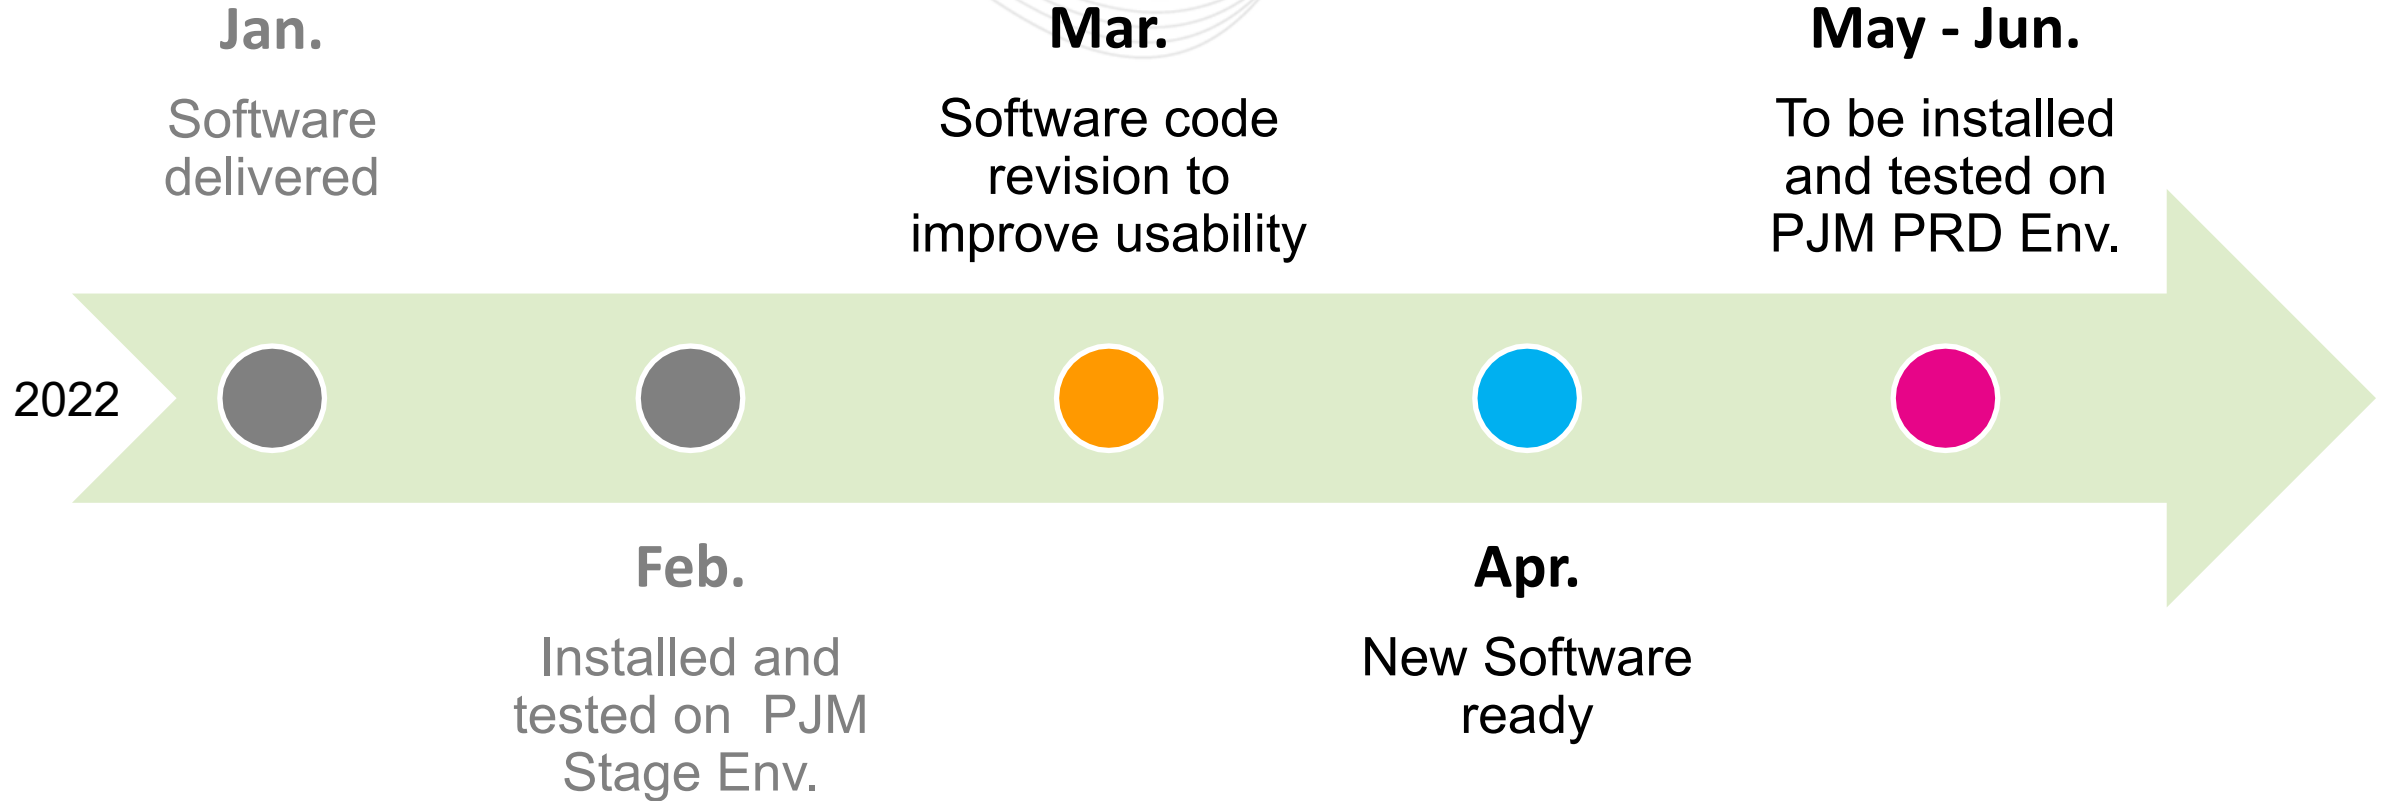

Model-less frequency event detection tool

Detect, triangulate and estimate the amplitude of generator, line and load center trips.

AGMV

- Improve process consistency
- Build a library of model validation events for each monitored generator.

Purpose

- To detect and identify wide-area forced and natural oscillations across Eastern Interconnection.

Status

- Finished field demonstration Mar. 2022.
- Daily summary and near real-time reports sent to ESAMS contributors.

Next Step

- Transition period: Apr.-Sep. 2022
- To discuss with EIDSN for future plan.
